

Exercise: Mapping Educational Attainment in New York

Summary

This exercise is an introduction to QGIS that uses the educational attainment results from a previous exercise.

Input Data

There are two input files on the Google drive for the course: **tl_2016_us_county.zip** a shapefile giving the boundaries of New York counties (derived from a Census TIGER/Line county file for the whole US), and **attainment.csv**, a file containing the results from the educational attainment assignment. Variables in the attainment file with prefix 'pct_' give the percentages of the population in the groups indicated by the suffix. The ratio variable is provided as well.

Deliverables

One QGIS project file called **attain.gqz** and two PNG images: one called **below_hs.png** that is a heat map of the 'pct_<hs' variable in **attainment.csv**, and another called **ratio.png** that is a heat map of the 'ratio' variable.

Instructions

1. Start a new project in QGIS.
2. Add the layer with country boundaries.
3. Use Save As to save the project to the GitHub directory for the assignment under the name 'attain' (an extension like '.gqz' will be added automatically). Be sure it ends up in the directory for the assignment so it will be pushed correctly.
4. Add county name labels and turn on the text buffer around the name.
5. Add the 'attainment.csv' file.
6. Join 'attainment.csv' onto the county layer using 'geoid' as the join key and 'at_' as the variable prefix.
7. Construct the heat map for 'pct_<hs' using equal intervals and 5 classes. You can use any color scheme you like.
8. Save the project again.
9. Export the map as **below_hs.png** and save it in the directory for the assignment.
10. Change the heat map to reflect 'pct_<hs'. Use pretty breaks and 5 classes. You can use any color scheme you like.
11. Export the new map as **ratio.png** to the directory for the assignment.

Submitting

Once you're happy with everything and have committed all of the changes to your local repository, please push the changes to GitHub. At that point, you're done: you have submitted your answer.

Tips

- If you want, you can create the second map by right-clicking on the first county layer, selecting 'Duplicate Layer', and then editing the new layer to match the second set of specifications. If you do that, you should rename the duplicated layer to something more meaningful than the original name with "copy" added. Right click on the name and look for the Rename Layer option. Once you've created the new layer you can switch back and forth between them by clicking on the check box next to the layer name in the Layers Panel.
